## 1. Purpose and Terms

The immediate attachment of an arc onto a straight or onto a counter arc affects passing vehicles through

- a sideways jolt through the sudden directional change as well as
- a counter displacement of the neighboring vehicle ends

In order to minimize these disturbing occurrences it is recommended to install transition curves (TC) on open track and in the through tracks of stations.
The TC is a curve of steadily changing radius, beginning at infinite radius at the transition from the straight, down to the radius of the connected curve.
TCs are especially advantageous on curves with small radius, whereas one can forgo TCs on curves with a radius of $>60 \mathrm{G}{ }^{1)}$. ${ }^{2)}$

## 2. Description

One half of the TC replaces a corresponding length of straight as well as curve.
For the connection of the TC to the straight and to the curve we

- either offset the straight by a value of $\boldsymbol{f}$ (Figure 1)
- or reduce the radius of the curve by a value of $\boldsymbol{f}$ (Figure 2 ).

## Figure 1:

Figure 2:

Counter arcs with TC can connect to each other directly without needing an intermediate straight. If super-elevation is intended in the track curve, pay attention to NEM 114.

[^0]
## 3. Dimensions

The characteristic dimensions of the TC are, in accordance with Figure 3
$L=$ Length of the TC,
$\mathbf{f}=$ Offset of the straight or reduction of the radius

Figure 3:

In order to determine the combination of values of $\boldsymbol{L}$ and $\boldsymbol{f}$ for a particular arc of radius $\boldsymbol{R}$, two methods are presented.

### 3.1 Applying recommended values

With this method, a constant value of $\boldsymbol{f}$ is determined per Table 1 for each gauge.
Table 1:

| Gauge G | 6.5 | 9 | 12 | 16.5 | 22.5 | 32 | 45 | 64 |
| :--- | ---: | :--- | :--- | :---: | :--- | :--- | :--- | :--- |
| Value f | 3 | 4 | 6 | 9 | 13 | 18 | 25 | 36 |

The TC length, $\boldsymbol{L}$, can be computed with the formula

$$
L=\sqrt{f .24 R}
$$

or can be read from Table 2 for selected arc radii:
Table 2:

| $\mathbf{G}$ | $\mathbf{R}$ | 150 | 175 | 200 | 250 | 300 | 350 | 400 | 500 | 600 | 700 | 800 | 1000 | 1200 | 1400 | 1600 | 2000 | 2500 |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :--- | :--- |
| 6.5 | 100 | 110 | 120 | 135 | 145 | 160 |  |  |  |  |  |  |  |  |  |  |  |  |
| 9 |  | 130 | 140 | 155 | 170 | 185 | 195 | 220 |  |  |  |  |  |  |  |  |  |  |
| 12 |  |  |  | 190 | 210 | 225 | 240 | 270 | 295 | 320 |  |  |  |  |  |  |  |  |
| 16.5 |  |  |  |  |  | 275 | 295 | 330 | 360 | 390 | 415 | 465 |  |  |  |  |  |  |
| 22.5 |  |  |  |  |  |  |  | 395 | 430 | 465 | 500 | 560 | 610 | 660 |  |  |  |  |
| 32 |  |  |  |  |  |  |  |  |  | 550 | 590 | 655 | 720 | 780 | 830 | 930 | 1040 | 1140 |
| 45 |  |  |  |  |  |  |  |  |  |  |  | 775 | 850 | 915 | 980 | 1095 | 1225 | 1340 |
| 64 |  |  |  |  |  |  |  |  |  |  |  |  |  | 1100 | 1175 | 1315 | 1470 | 1610 |

### 3.2 Applying arbitrary TC lengths

The TC length, $\boldsymbol{L}$, can be selected feely and independent of arc radius under the following conditions:

- $\quad \boldsymbol{L}$ must be smaller than $\boldsymbol{R}$, ideally $<0.8 \boldsymbol{R}$,
- $\quad L$ should be no less than the length of the longest passing vehicle.

The value $\boldsymbol{f}$ is computed per Table 3, dependent on the ratio $L: \boldsymbol{R}$.
Table 3:

| $\mathrm{L} / \mathbf{R}$ | $<0.6$ | $0.6-0.8$ | $>0.8$ <br> (avoid) |
| :--- | :---: | :---: | :---: |
| $\mathbf{f}$ | $\frac{\mathrm{L}^{2}}{24 R}$ | $\frac{\mathrm{~L}^{2}}{23 R}$ | $\frac{\mathrm{~L}^{2}}{22 \mathrm{R}}$ |

## 4. Implementation ${ }^{3)}$

After the values $L$ and $\boldsymbol{f}$ have been determined, one can mark the endpoints of the TB $\boldsymbol{U A}$ and $\boldsymbol{U E}$ by

- drawing a line parallel to the straight at its determined final location, at a offset of $\boldsymbol{y}_{\boldsymbol{E}}=4 \boldsymbol{f}$, which intersects the arc at the point UE (Figure 4),
- the TC length, L , with the straight at its determined position, measured back from the perpendicular from point UE, determines point UA.

For depiction of the TC on can choose between two methodologies:

### 4.1 Construction via intermediate points

The intermediate values $\boldsymbol{y}_{\boldsymbol{i}}$ are computed as part of the end value $\boldsymbol{y}_{\mathbf{E}}$ from Table 4.
Figure 4:

Table 4:

| $\mathbf{x}_{\mathbf{i}}$ | 0 | 0.3 L | 0.4 L | 0.5 L | 0.6 L | 0.7 L | 0.8 L | 0.9 L | 1.0 L |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{y}_{\mathbf{i}}$ | 0 | 0.03 yE | 0.06 yE | $0.125 \mathrm{yE}=0.5 \mathrm{f}$ | 0.21 yE | 0.33 yE | 0.49 yE | 0.72 yE | $1.0 \mathrm{yE}=4 \mathrm{f}$ |

Examples:
Given: Gauge $G=16.5$ und Arc radius $R=600$
Method 3.1
Method 3.2

| Method 3.1 |  | Method 3.2 |  |
| :---: | :---: | :---: | :---: |
| Value $\boldsymbol{f}$ per Table 1: | $\mathrm{f}=9$ | Chosen TC length: | $\mathbf{L}=0,7 \mathbf{R}=420$ |
| TC length per Table 2: | L = 360 | Value $\boldsymbol{f}$ per Table 3: | $\mathbf{L}^{2} / 23 \mathbf{R} \approx 13$ |
| End value: | $\boldsymbol{y}_{\mathbf{E}}=4 \mathrm{f}=36$ | End value: | $\boldsymbol{y}_{E}=4 \mathrm{f}=52$ |

Computation of the values $\boldsymbol{y}_{i}$ for the intermediate point $\boldsymbol{x}_{i}=0.7 \mathrm{~L}$ (Table 4):

$$
\begin{aligned}
& x_{i}=0.7 \cdot 360=252 \\
& y_{i}=0.33 \cdot 36 \approx 12
\end{aligned} \quad \begin{aligned}
& x_{i}=0.7 \cdot 420=294 \\
& y_{i}=0.33 \cdot 52 \approx 17 \\
& \\
& \text { (similarly for other intermediate points) }
\end{aligned}
$$

## Note:

For smaller gauges it is generally sufficient to mark the intermediate points at $0.3 / 0.5 / 0.7 \mathbf{L}$.

[^1]
### 4.2 Utilization of a flexible guide

The TC can be drawn with a flexible guide prepared per Figure 5. Best suited is a rectangular elastic metal bar which naturally returns to its original position, of dimensions approximately that of the rail profile.
The end of the guide is reinforced with a plate, which simultaneously serves as a way to affix it to the underlayment.

The guide is laid tangential to the arc at point UE and affixed via the plate to the underlayment. By bending the guide toward point UA one obtains an arc that can be traced to draw the TC (Figure 6).

Figure 6:

[^0]:    1) $G=$ Gauge
    ${ }^{2}$ ) This simplification is not valid when applying NEM 111, section 3.2.
[^1]:    ${ }^{3)}$ Because railroad modelers will generally limit themselves to a selected set of arc radii, it is recommended that one make a template for the required TC using one of the described methods.
